# one-hot-encode-technique-2

April 2, 2024

Categorical Variables and One Hot Encoding

[55]:
```
import pandas as pd
df=pd.read_csv('/content/homeprices (2).csv')
df
```

[55]:

| | town | area | price |
|---|---|---|---|
| 0 | monroe township | 2600 | 550000 |
| 1 | monroe township | 3000 | 565000 |
| 2 | monroe township | 3200 | 610000 |
| 3 | monroe township | 3600 | 680000 |
| 4 | monroe township | 4000 | 725000 |
| 5 | west windsor | 2600 | 585000 |
| 6 | west windsor | 2800 | 615000 |
| 7 | west windsor | 3300 | 650000 |
| 8 | west windsor | 3600 | 710000 |
| 9 | robinsville | 2600 | 575000 |
| 10 | robinsville | 2900 | 600000 |
| 11 | robinsville | 3100 | 620000 |
| 12 | robinsville | 3600 | 695000 |

Using pandas to create dummy variables

[56]:
```
dummies=pd.get_dummies(df.town)
dummies
```

[56]:

| | monroe township | robinsville | west windsor |
|---|---|---|---|
| 0 | 1 | 0 | 0 |
| 1 | 1 | 0 | 0 |
| 2 | 1 | 0 | 0 |
| 3 | 1 | 0 | 0 |
| 4 | 1 | 0 | 0 |
| 5 | 0 | 0 | 1 |
| 6 | 0 | 0 | 1 |
| 7 | 0 | 0 | 1 |
| 8 | 0 | 0 | 1 |
| 9 | 0 | 1 | 0 |
| 10 | 0 | 1 | 0 |

```
11                0            1             0
12                0            1             0
```

cocatenate dummies df with the original df

[57]:
```
merged = pd.concat([df,dummies],axis='columns')
merged
```

[57]:

| | town | area | price | monroe township | robinsville | west windsor |
|---|---|---|---|---|---|---|
| 0 | monroe township | 2600 | 550000 | 1 | 0 | 0 |
| 1 | monroe township | 3000 | 565000 | 1 | 0 | 0 |
| 2 | monroe township | 3200 | 610000 | 1 | 0 | 0 |
| 3 | monroe township | 3600 | 680000 | 1 | 0 | 0 |
| 4 | monroe township | 4000 | 725000 | 1 | 0 | 0 |
| 5 | west windsor | 2600 | 585000 | 0 | 0 | 1 |
| 6 | west windsor | 2800 | 615000 | 0 | 0 | 1 |
| 7 | west windsor | 3300 | 650000 | 0 | 0 | 1 |
| 8 | west windsor | 3600 | 710000 | 0 | 0 | 1 |
| 9 | robinsville | 2600 | 575000 | 0 | 1 | 0 |
| 10 | robinsville | 2900 | 600000 | 0 | 1 | 0 |
| 11 | robinsville | 3100 | 620000 | 0 | 1 | 0 |
| 12 | robinsville | 3600 | 695000 | 0 | 1 | 0 |

dropping one of the dummy variable columns so as not to create multicollinearity

[58]:
```
final = merged.drop(['town','west windsor'],axis='columns')
final
```

[58]:

| | area | price | monroe township | robinsville |
|---|---|---|---|---|
| 0 | 2600 | 550000 | 1 | 0 |
| 1 | 3000 | 565000 | 1 | 0 |
| 2 | 3200 | 610000 | 1 | 0 |
| 3 | 3600 | 680000 | 1 | 0 |
| 4 | 4000 | 725000 | 1 | 0 |
| 5 | 2600 | 585000 | 0 | 0 |
| 6 | 2800 | 615000 | 0 | 0 |
| 7 | 3300 | 650000 | 0 | 0 |
| 8 | 3600 | 710000 | 0 | 0 |
| 9 | 2600 | 575000 | 0 | 1 |
| 10 | 2900 | 600000 | 0 | 1 |
| 11 | 3100 | 620000 | 0 | 1 |
| 12 | 3600 | 695000 | 0 | 1 |

create a linear regression model

[59]:
```
from sklearn.linear_model import LinearRegression
model = LinearRegression()
```

find x in the model and remove the price column since its a dependent variable

[60]:
```
x = final.drop('price', axis='columns')
x
```

[60]:

| | area | monroe township | robinsville |
|---|---|---|---|
| 0 | 2600 | 1 | 0 |
| 1 | 3000 | 1 | 0 |
| 2 | 3200 | 1 | 0 |
| 3 | 3600 | 1 | 0 |
| 4 | 4000 | 1 | 0 |
| 5 | 2600 | 0 | 0 |
| 6 | 2800 | 0 | 0 |
| 7 | 3300 | 0 | 0 |
| 8 | 3600 | 0 | 0 |
| 9 | 2600 | 0 | 1 |
| 10 | 2900 | 0 | 1 |
| 11 | 3100 | 0 | 1 |
| 12 | 3600 | 0 | 1 |

[61]:
```
y = final.price
y
```

[61]:
```
0     550000
1     565000
2     610000
3     680000
4     725000
5     585000
6     615000
7     650000
8     710000
9     575000
10    600000
11    620000
12    695000
Name: price, dtype: int64
```

Training the machine learning model

[62]:
```
model.fit(x,y)
```

[62]:
```
LinearRegression()
```

making predictions

[63]:
```
model.predict([[2800,0,1]])
```

```
/usr/local/lib/python3.10/dist-packages/sklearn/base.py:439: UserWarning: X does
not have valid feature names, but LinearRegression was fitted with feature names
  warnings.warn(
```

[63]:
```
array([590775.63964739])
```

[64]:
```
model.predict([[3400,0,0]])
```

```
/usr/local/lib/python3.10/dist-packages/sklearn/base.py:439: UserWarning: X does
not have valid feature names, but LinearRegression was fitted with feature names
  warnings.warn(
```

[64]:
```
array([681241.66845839])
```

Measuring the accuracy of a model

[65]:
```
model.score(x,y)
```

[65]:
```
0.9573929037221872
```

[66]:
```
df
```

[66]:

| | town | area | price |
|---|---|---|---|
| 0 | monroe township | 2600 | 550000 |
| 1 | monroe township | 3000 | 565000 |
| 2 | monroe township | 3200 | 610000 |
| 3 | monroe township | 3600 | 680000 |
| 4 | monroe township | 4000 | 725000 |
| 5 | west windsor | 2600 | 585000 |
| 6 | west windsor | 2800 | 615000 |
| 7 | west windsor | 3300 | 650000 |
| 8 | west windsor | 3600 | 710000 |
| 9 | robinsville | 2600 | 575000 |
| 10 | robinsville | 2900 | 600000 |
| 11 | robinsville | 3100 | 620000 |
| 12 | robinsville | 3600 | 695000 |

#Using sklearn OneHotEncoder

In order to use one hot encording you need to do lebel encording on the town column

[67]:
```
from sklearn.preprocessing import LabelEncoder
```

[68]:
```
le = LabelEncoder()
```

[69]:
```
dfle =df
dfle.town = le.fit_transform(dfle.town)
dfle
```

[69]:

| | town | area | price |
|---|---|---|---|
| 0 | 0 | 2600 | 550000 |
| 1 | 0 | 3000 | 565000 |
| 2 | 0 | 3200 | 610000 |
| 3 | 0 | 3600 | 680000 |
| 4 | 0 | 4000 | 725000 |
| 5 | 2 | 2600 | 585000 |
| 6 | 2 | 2800 | 615000 |
| 7 | 2 | 3300 | 650000 |
| 8 | 2 | 3600 | 710000 |
| 9 | 1 | 2600 | 575000 |
| 10 | 1 | 2900 | 600000 |
| 11 | 1 | 3100 | 620000 |
| 12 | 1 | 3600 | 695000 |

[70]:
```
x =dfle[['town', 'area']].values
x
```

[70]:
```
array([[   0, 2600],
       [   0, 3000],
       [   0, 3200],
       [   0, 3600],
       [   0, 4000],
       [   2, 2600],
       [   2, 2800],
       [   2, 3300],
       [   2, 3600],
       [   1, 2600],
       [   1, 2900],
       [   1, 3100],
       [   1, 3600]])
```

[71]:
```
y = dfle.price
y
```

[71]:
```
0     550000
1     565000
2     610000
3     680000
4     725000
5     585000
6     615000
7     650000
8     710000
9     575000
10    600000
11    620000
```

```
12    695000
Name: price, dtype: int64
```

Import one hot encorder

[72]:
```
from sklearn.preprocessing import OneHotEncoder
```

[73]:
```
from sklearn.preprocessing import OneHotEncoder
```

[74]:
```
ohe = OneHotEncoder
```

[93]:
```
ohe = OneHotEncoder(sparse=False)  # Avoid sparse matrix output
x_encoded = ohe.fit_transform(x)
print(x_encoded)
```

```
[[1. 0. 0. 1. 0. 0. 0. 0. 0. 0. 0.]
 [1. 0. 0. 0. 0. 0. 1. 0. 0. 0. 0.]
 [1. 0. 0. 0. 0. 0. 0. 0. 1. 0. 0.]
